Project Euler #223: Almost right-angled triangles I

This problem is a programming version of Problem 223 from projecteuler.net

Let us call an integer sided triangle with sides $a \leq b \leq c$ barely acute if the sides satisfy $a^2 + b^2 = c^2 + 1$.

How many barely acute triangles are there with perimeter no greater than N ?

Input Format

First line of each test file contains a single integer Q that is the number of queries per test file. Q lines follow, each with a single integer N.

Constraints

- $1 \le Q \le 50$
- $10 \le N \le 5 \times 10^7$

Output Format

Print exactly $oldsymbol{Q}$ lines with an answer for the corresponding query on each.

Sample Input 0

1 21

Sample Output 0

12

Explanation 0

The only barely acute triangles with perimeter no greater than 21 are (1,1,1),(1,2,2),(1,3,3),(1,4,4),(1,5,5),(1,6,6),(1,7,7),(1,8,8),(5,5,7),(1,9,9),(4,7,8),(1,10,10); twelve total.
